Transactions

Fund Transfer Between EOA

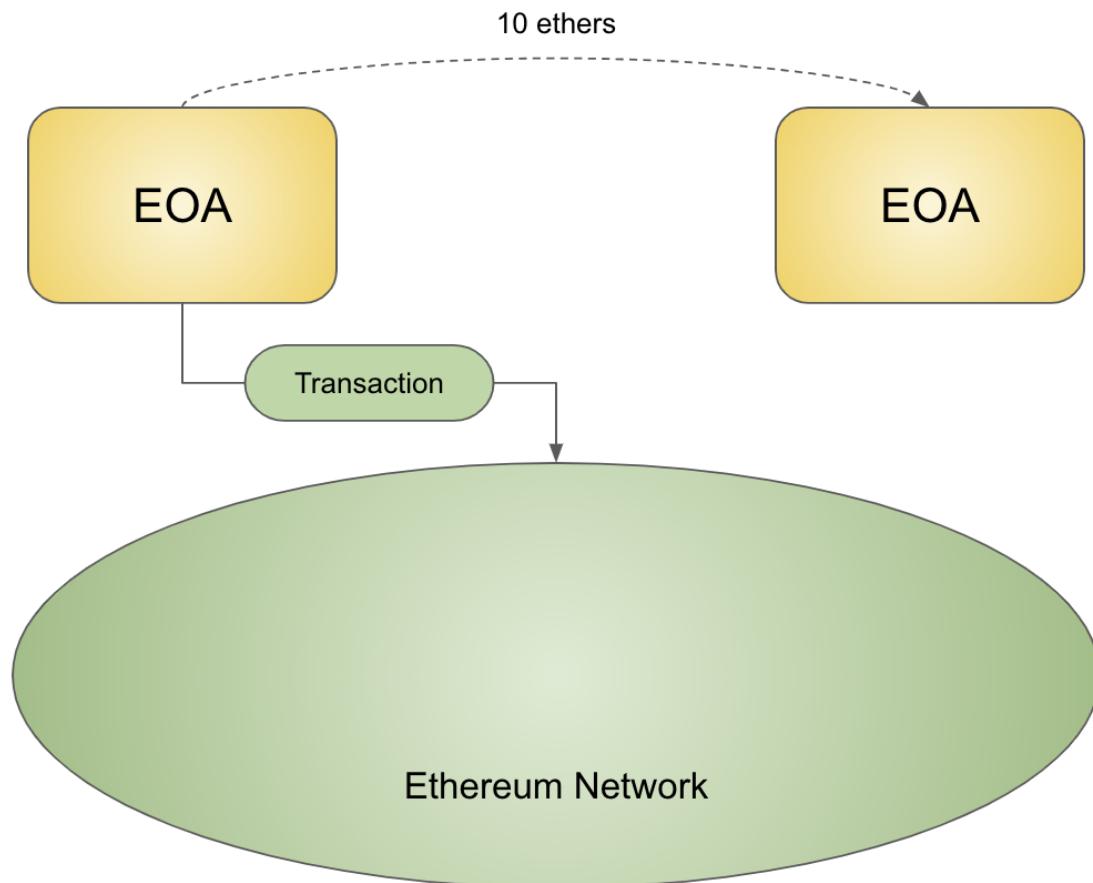

Deploy a Contract on Ethereum Network

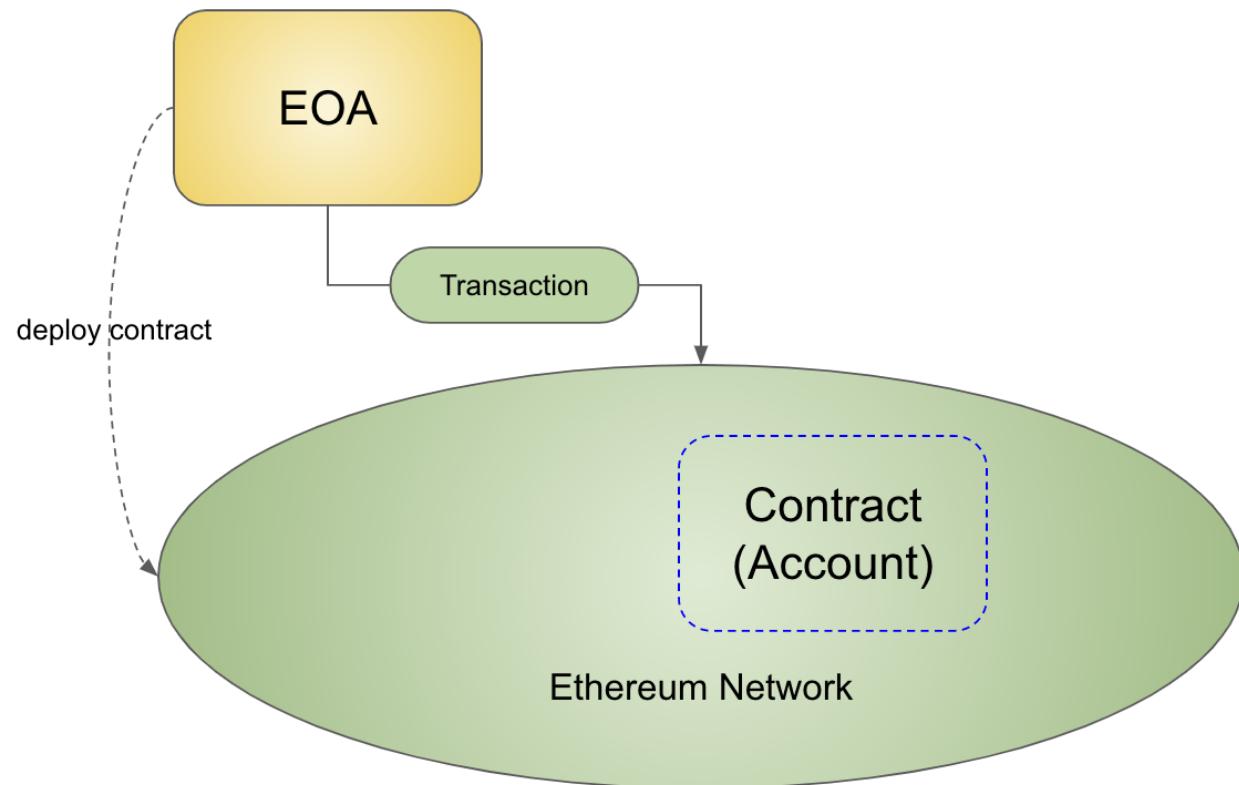

Execute a Function on a Deployed Contract

Fund Transfer Between EOA

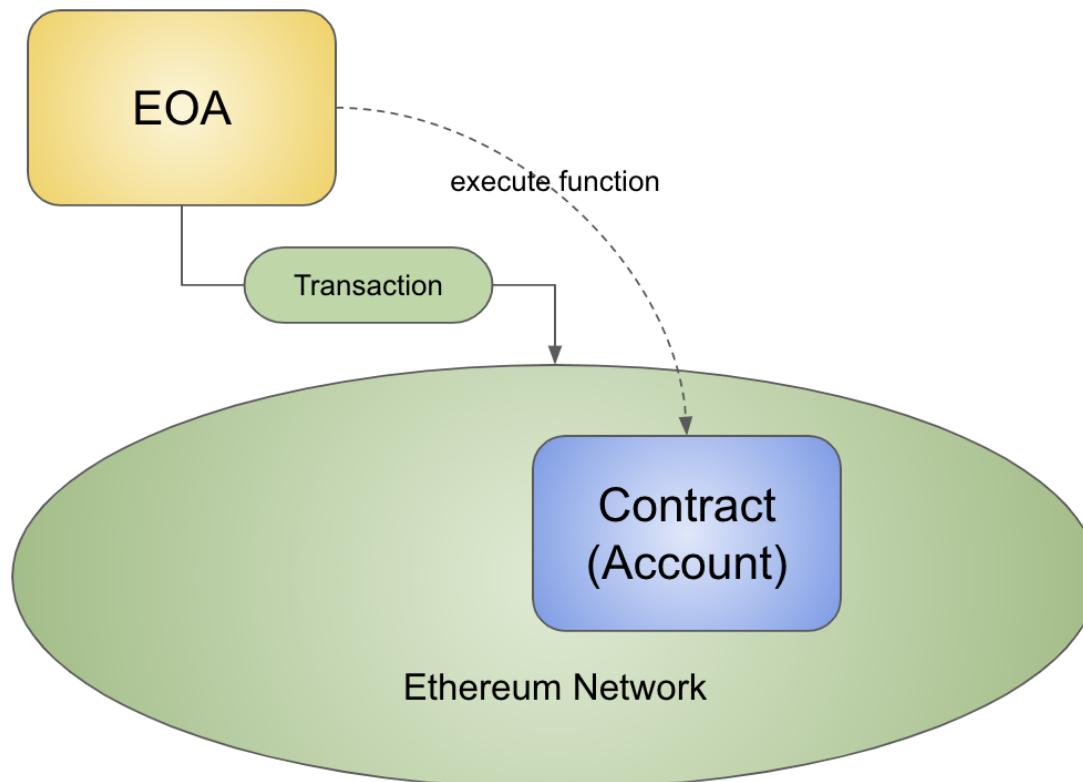

From	Fund sender, an EOA (20-byte address)
To	Fund recipient, another EOA (20-byte address)
Value	Amount, in weis
Data / Input	Empty
Gas Limit <input type="checkbox"/>	Larger enough for an ether transfer transaction
Gas Price	To be determined by transaction initiator

Deploy a Contract on Ethereum Network

From	Contract deployer, an EOA (20-byte address)
To	Empty
Value	Amount, in weis (if required by contract constructor)
Data / Input	Bytecode, plus any encoded arguments if required by constructor
Gas Limit	Larger enough for contract deployment
Gas Price	To be determined by transaction initiator

Execute a Function on a Deployed Contract

From	Function executor, an EOA (20-byte address)
To	Contract Address (20-byte address)
Value	Amount, in weis (if needed in contract function)
Data / Input	Function selector, plus any encoded arguments required by function
Gas Limit	Larger enough for contract function execution
Gas Price	To be determined by transaction initiator

Smart Contract

A contract is a legal document that binds two or more parties who agree to execute a transaction immediately or in the future.

A smart contract is a contract implemented, deployed and executed within the Ethereum environment

The screenshot shows the Remix Ethereum IDE interface. The top navigation bar has tabs for various Ethereum-related resources. The main workspace is titled "FILE EXPLORERS" and contains a file tree with "browser" and "Coin.sol". The "Coin.sol" file is currently selected and displayed in the central code editor. The code is a Solidity smart contract named "Coin" with two functions: "sendTokens" and "getTokens". The bottom section of the interface includes a terminal window, a search bar, and a help section.

```
pragma solidity ^0.6.1;

contract Coin {
    address private minter;
    uint private countCoins = 0;
    mapping (address => uint) private balances;

    constructor(uint initialCoins) public {
        minter = msg.sender;
        countCoins = initialCoins;
        balances[minter] = initialCoins;
    }

    function sendTokens(address user, uint count) public {
        balances[msg.sender] -= count;
        balances[user] += count;
    }

    function getTokens(address user) public view returns (uint) {
        if (msg.sender == minter) {
            return balances[user];
        }
    }
}
```

- Welcome to Remix v0.9.4 -

You can use this terminal for:

- Checking transactions details and start debugging.
- Running JavaScript scripts. The following libraries are accessible:
 - web3 version 1.0.0
 - ethers.js
 - swarmgw
 - remix (run remix.help() for more info)
- Executing common command to interact with the Remix interface (see list of commands above). Note that these commands can also be included and run from a JavaScript script.
- Use exports/.register(key, obj)/.remove(key)/.clear() to register and reuse object across script executions.

Welcome to the Remix IDE!

You can use the following commands in the terminal:

- Checking the current version: `remix --version`
- Running Java code: `web3j --version`, `ethers --version`, `swarmgw --version`, `remix --version`
- Executing a command from a file: `remix run script.js`
- Use `exports/.register(key, obj)/.remove(key)/.clear()` to register and reuse object across script executions.

Close

ands above). Note that these commands can also be included and r
